SEARCH REQUEST FORM

6-214

Requestor's Shella Hirff Serial Number: 08/73/565

Date: 10/9/97 Phone: 305-7866 Art Unit: 1806

Search Topic:

Please write a detailed statement of search topic. Describe specifically as possible the subject matter to be searched. Define any terms that may have a special meaning. Give examples or relevant citations, authors keywords, etc., if known. For sequences, please attach a copy of the sequence. You may include a copy of the broadest and/or most relevant claim(s).

Notes of the tumour rejection antigen precursor - is not be sequence represents the tumour rejection antigen precursor - is processed for developing prods. for diagnosis or treatment of expression related disorders, partic. melanoma or related disorders, partic. melanoma or related disorders, partic. melanoma or related disorders partic. This sequence represents the tumour rejection antigen presented by HLA-A2 molecules. The tumour rejection antigen presented by HLA-A2 molecules. The tumour rejection antigen is not related to tyrosinase. The CDNA concoling this sequence was isolated from the melanoma cell line, company the tumour rejection antigen may be used for diagnosis or in vaccines or for therapy of disorders characterised by the expression of the tumour rejection antigen precursor, particularly melanoma. Sequence 118 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Example 5: Page 105: 184pp: English.

R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MARR-1 from a sample, the detection of which is
methods, i.e. preferably using a baculovirus vector for expression in insect cell cultures. MART-1 protein is a source of immunogenic peptides (see R84196 for peptide M9-2) which are optionally modified (see R84783-R84800) and used in mediacments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 105: 184pp: English.

R84789-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MARR-1 from a sample, the detection of which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 105: 184pp: English.

EXAMPLE 5: Page 105: 184pp: English.

EXAMPLE 5: Poptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RAWAKAMI Y, Rosenberg SA;

NPT: 95-38263/49.

The moroding melanoma antigens recognised by T-lymphocytes - also by a mechanise and antibodies, used to detect, treat and immunise animal against melanoma.

Example 2; Page 72: 184pp; English.

Immunogenic peptide M9-3 is based on the melanoma antigen (MART-1) (see R84763-R84782) and used in medicaments (vaccines) for treatment or prevention (by immunisation) of melanoma.

Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma

WPI and antibodies, used to detect, treat and immunise animal against melanoma.
Example 5; Page 105; 184pp; English.
WR4783-800 are MP-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and its immunogenic peptides may be used in the detection of MART-1 indication of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                            prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma). Sequence 9 AA;

Mean 21.480; Variance 27.992; scale 0.767 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 15.466; Variance 45.800; scale 0.338 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nucleic acid coding for a tumour rejection antigen precursor - is

Nucleic acid coding for diagnosis or treatment of expression

Telated disorders, partic. melanoma

Telated disorders, partic. melanoma

Telated disorders, partic. melanoma

Telated disorders, partic. melanoma

This sequence represents the tumour rejection antigen precursor which is

processed to a tumour rejection antigen presented by HiA-A2 molecules.

The tumour rejection antigen is not related to tyrosinase. The cona

cocoding this sequence was isolated from the melanoma cell line,

IB-39-WEL. The tumour rejection antigen may be used for diagnosis or

in vaccines or for therapy of disorders characterised by the expression

of the tumour rejection antigen precursor, particularly melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Claim 11: Page 117: 184pp: English.

The melanoma antigen (MART-1) is produced by recombinant DNA methods, i.e. preferably using a baculovirus vector for expression in insect cell cultures. MART-1 protein is a source of immunogenic peptides (see R84196 for peptide M9-2) which are optionally modified (see R84783-R84800) and used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolative of a disease state (melanoma or metastatic melanoma).

DNA encoding melanoma antibodies, used to detect, treat and immunise animal against melanoma.
Claim 12: Page 117: 184pp; English.
Immunogenic peptide M9-2 is based on the melanoma antigen (MART-1) (see R84212). M9-2 may be modified to improve immunogenicity (see R84783-R84800) and used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is

EXAMPLE 5: Peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and is manuagenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

M9-2 may be modified to improve immunogenicity (see R84783-R84800) and used in medicaments for the treatment or prevention (by immunozation) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     25-APR-1996 (first entry)

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5; Page 105: 184pp; English.

RR4783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see an immunogenic peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

WR4783-800 are MP-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or an immunogenic peptides may be used in the detection and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunists animal against melanoma.

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 105: 184pp; English.

R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma anityen (MART-1) (see PR4212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunise animal against melanoma.

WPI: 95-382963/49.

DNA encoding melanoma antigens recognised by T-lymphocytes - also
vectors, host cells and antibodies, used to detect, treat and
immunise animal against melanoma.

Example 5; Page 105; 184pp; English.

R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is
an immunogenic peptide based on the melanoma antigen (MART-I) (see
R84212). The peptides are used in medicaments for the treatment or
                                                                                                                                                                                                                                                             ő

Mean 22.055; Variance 28.889; scale 0.763 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NT This is a component of the enzyme complex that catalyzes 2,
6-dichlorophenolindophenol-dependent cleavage of acetoin into
acetate and acetaldehyde. The functional enzyme is a tetramer of
two alpha and two beta chains.

IFICATION #superfamily pyruvate dehydrogenase (lipoamide) alpha chain;
thiamine pyrophosphate-binding domain homology
heterotetramer; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  H+-transporting ATP synthase (EC 3.6.1.34) proteolipid chain - Sulfolobus acidocaldarius #formal_name Sulfolobus acidocaldarius 20-Dec-1989 #sequence_revision 20-Dec-1989 #text_change 23-Jun-1993

#MENT Gene D protein is a major component of the phage head and serves to
stabilize the head during DNA packaging. There are approximately
420 copies of protein D per mature phage.
                                                                                                                                                     ö

-! CATALYTIC ACTIVITY: 5-METHYLTETRAPENDROFTEROYLETRI-L-GLUTAMATE +

-!- CATALYTIC = TETRAHYDROPTEROYLETI-GLUTAMATE + L-METHIONINE.

-!- HOMOCYSTEINE = TETRAHYDROPTEROYLETI-GLUTAMATE + L-METHIONINE.

-!- HAS AN ABSOLUTE REQUIREMENT FOR A POLYGLUTAMYLATED FOLATE AS

SUBSTRATE. ITS ACTIVITY DEPENDS ON PHOSPHATE ANIONS AND DIVALENT

FLAGELIAR HOOK-ASSOCIATED PROTEIN 2 (HAP2) (FILAMENT CAP PROTEIN).
FLID OR FLEC OR FLAV.
ESCHERICHIA COLI.
PROKARYOTA: GRACILICUTES; SCOTOBACTERIA; FACULTATIVELY ANAEROBIC RODS;
J. BACTERIOL. 175:6150-6157(1993).

-!- FUNCTION: BIFUNCTIONAL ENZYME RESPONSIBLE FOR THE ACETYLATION OF GLC-N-1-P TO GIVE GLCNAC-1-P AND THE SYNTHESIS OF UDP-GLCNAC.
-!- CATALYTIC ACTIVITY: UTP + N-ACETYL-ALPHA-D-GLUCOSAMINE.
-!- PHOSPHATE = PYROPHOSPHATE + UDP-N-ACETYL-D-GLUCOSAMINE.
-!- PATHWAY: PEPTIDOGLYCAN AND LIPOPOLYSACCHARIDE BIOSYNTHESIS.
-!- CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT THAT CREATES TWO ORFS.
-!- SIMILARITY: BELONGS TO THE CYSE/LACA/LDXA/NODL FAMILY OF A CETYLITANNSERASES. COMPOSED OF MULTIPLE REPEATS OF [LIV]-G-X(4).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE; 83238225.

WPISDB: Q06310.

Nucleic acid coding for a tumour rejection antigen precursor - is used for developing prods. for diagnosis or treatment of expression related disorders, partic. melanoma (Zdaim 5; Page 14; 26pp; English.

This sequence represents the tumour rejection antigen precursor which is processed to a tumour rejection antigen presented by HiA-A2 molecules. The tumour rejection antigen is not related to tyrosinase. The CDNA encoding this sequence was isolated from the melanoma cell line, LB-39-MEL. The tumour rejection antigen may be used for diagnosis or in vaccines or for therapy of disorders characterised by the expression of the tumour rejection antigen precursor, particularly melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA encoding methanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Claim 11; Page 117; 184pp; English.

Claim 11; Page 117; 184pp; English.

The melanoma antigen (MART-1) is produced by recombinant DNA methods, 1.e. preferably using a baculovirus vector for expression in insect cell cultures. MART-1 protein is a source of immunogenic peptides (see R84196 for peptide M9-2) which are optionally modified (see R8439.R8480) and used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 12; Page 117; 184pp; English.

Immunogenic peptide M9-2 is based on the melanoma antigen (MART-1) (see R84212). M9-2 may be modified to improve immunogenicity (see R84783-R84800) and used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 12; Page 12ž; 184pp; English.
Immunogenic peptide M10-3 is a derivative of peptide M9-2 (R84196)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors. Nost cells and antibodies, used to detect, treat and immunise animal against melanoma.

which is based on the melanoma antigen (WART-1) (see R84212).
M9-2 may be modified to improve immunogenicity (see R84783-R84800)
and used in medicaments for the treatment or prevention (by
immunization) of melanoma. Antibodies against WART-1 and its
immunogenic peptides may be used in the detection and isolation of
MART-1 from a sample, the detection of which is indicative of a
disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                       vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Example 2; Bage 72: 184pp; English.

Immunogenic peptide M9-3 is based on the melanoma antigen (MART-1) (see R84712).

See R84763-R84782) and used in medicaments (vaccines) for treatment or prevention (by immunization) of melanoma.

Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isoclation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
Example 5; Page 105; 184pp; English.
Example 5; Page 105; 184pp; English.
R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunisation) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

WPA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.
Example 5; Page 105; 184pp; English.
R84783-800 are M9-2 peptides modified to improve immunogenicity. M9-2 an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MARR-1 from a sample, the detection of which is

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host calls and antibodies, used to detect, treat and immunise animal against melanoma.

Example 5: Page 105: 184pp; English.

Example 5: Page 105: 184pp; English.

Example 5: Peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and is amminogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ahol/gill region and any other nonessential region of the PV genome can be manipulated to produce the deletions and insertions by standard recombinant DNA techniques. Recombinants can be used for the prodn. of desired proteins. Antigens produced are useful in diagostic kits and as vaccines (claimed). also, the PV engineered to contain the genes for appropriate antigens also should have utility as a live vaccine.
                                                                                          Complete sequence of the pseudorabies virus (PRV) gIII glycoprotein gene (noncoding strand)

EXAMPLE 5; Page 105; 184pp; English.

EXAMPLE 5; Peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (PART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its munogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

R84783-800 are W9.2 peptides modified to improve immunogenicity. M9-2 is an immunogenic peptide based on the melanoma antigen (MART-1) (see R84212). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

PR WPI: 95-38296349.

PR melanoma antigens recognised by T-lymphocytes - also by rectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

PR Example 5; Page 105; 184pp; English.

R84738-800 are M9-2 peptides modified to improve immunogenicity. M9-2 is can immunogenic peptide based on the melanoma antigen (MART-1) (see CC R84212). The peptides are used in medicaments for the treatment or cc prevention (by immunization) of melanoma. Antibodies against MART-1 cand its immunogenic peptides may be used in the detection and cc isolation of MART-1 from a sample, the detection of which is cc indicative of a disease state (melanoma or metastatic melanoma).
